Long-term research questions

- ▶ What **linguistic representations** can be used robustly and efficiently in automatic meaning comparison?
- ▶ What is the role of **context** and how can we utilize knowledge about it in comparing meaning automatically?
 - ▶ Context here means questions and reading texts in reading comprehension tasks.

Aims of this talk

- ▶ Present first content assessment approach for German
- ▶ Explore impact of
 - ▶ question types and
 - ▶ ways of encoding information in the text
- ▶ Discuss the importance of explicit language-based context
 - ▶ here: information structure of answers given questions and text

Connection to RTE and Textual Inference

- ▶ What is Content Assessment?
 - ▶ The task of determining whether a response actually answers a given question about a specific text.
- ▶ Two possible perspectives in connection with RTE:
 1. Decide whether reading text T supports student answer SA , i.e., whether SA is entailed by T .
 2. Decide whether student answer SA is paraphrase of target answer TA . \Rightarrow bi-directional entailment

In this talk, we focus on the second perspective.

Example from our corpus

T:  (Reading comprehension text)

Q: Was sind die Kritikpunkte, die Leute über Hamburg äußern?

'What are the objections people have about Hamburg?'

TA: Der Gestank von Fisch und Schiffsdiesel an den Kais .

The stink of fish and fuel on the quays .

SA: Der Geruch von Fish und Schiffsdiesel beim Hafen .

The smell of_{err} fish_{err} and fuel at the port .

General CoMiC Approach

(Bailey & Meurers 2008; Meurers, Ziai, Ott & Bailey 2011)

The overall approach has three phases:

1. **Annotation** uses NLP to enrich the student and target answers, as well as the question text, with linguistic information on different levels and types of abstraction.
2. **Alignment** maps elements of the learner answer to elements of the target response using annotation.
 - ▶ Global alignment solution computed by Traditional Marriage Algorithm (Gale & Shapley 1962)
3. **Classification** analyzes the possible alignments and labels the learner response with a binary content assessment and a detailed diagnosis code.

Classification

Features

- ▶ Content Assessment is based on 13 features:

% of Overlapping Matches:

- ▶ keyword (head)
- ▶ target/learner token
- ▶ target/learner chunk
- ▶ target/learner triple

Nature of Matches:

- ▶ % token matches
- ▶ % lemma matches
- ▶ % synonym matches
- ▶ % similarity matches
- ▶ % sem. type matches
- ▶ match variety

- ▶ target/learner chunk
- ▶ target/learner triple

Nature of Matches:

- ▶ % token matches
- ▶ % lemma matches
- ▶ % synonym matches
- ▶ % similarity matches
- ▶ % sem. type matches
- ▶ match variety

- ▶ We combined the evidence with memory-based learning (TiMBL, Daelemans et al. 2007)
 - ▶ Trained seven classifiers using different distance metrics, overall outcome obtained through majority voting.
 - ▶ Used *leave-one-out* testing: For each test item train on all answer pairs except the test item itself.

Experiment

Overall results

	KU data set	OSU data set
# of answers	610	422
Accuracy	84.6%	84.6%

- ▶ Remarkable similarity of results across completely different data sets
- ▶ Same overall results when macro-averaging over individual questions
- ▶ Competitive with results obtained for English (78%) in Bailey & Meurers (2008) and related results of C-Rater for short answer scoring (Leacock & Chodorow 2003).

Detailed Evaluation

- ▶ Global accuracy scores do not tell us how well the system fares, e.g., in terms of question types.
- ▶ First step towards deeper analysis of results: manual annotation of reading comprehension question properties
- ▶ Annotation scheme follows Day & Park (2005) guidelines for development of reading comprehension questions
 - ▶ Comprehension Types:
 - ▶ nature & depth of comprehension required by learner to answer the question
 - ▶ in our data: “Literal”, “Reorganization” and “Inference”
 - ▶ Question Forms:
 - ▶ Surface-based question classes such as “yes/no” or “who” questions

Most important results

Comprehension types

	Literal	Reorganization	Inference	Total
Alternative	0 (1)	- (0)	66.67 (6)	57.14 (7)
How	85.71 (126)	83.33 (12)	100 (7)	86.21 (145)
What	87.04 (247)	74.19 (31)	83.33 (6)	85.56 (284)
When	85.71 (7)	- (0)	- (0)	85.71 (7)
Where	88.89 (9)	- (0)	- (0)	88.89 (9)
Which	92.35 (183)	100 (14)	83.33 (6)	92.61 (203)
Who	73.91 (23)	94.44 (18)	- (0)	82.93 (41)
Why	80.47 (128)	57.14 (14)	84.38 (32)	79.31 (174)
Yes/No	- (0)	100 (5)	- (0)	100 (5)
Several	82.11 (95)	68.42 (38)	75 (24)	77.71 (157)
Total	85.96 (819)	78.03 (132)	81.48 (81)	84.59 (1032)

- ▶ “Literal” questions (86.0%) seem to be easier than “Reorganization” (78.0%) and “Inference” (81.5%).

Most important results

Question forms: easy case

	Literal	Reorganization	Inference	Total
Alternative	0 (1)	– (0)	66.67 (6)	57.14 (7)
How	85.71 (126)	83.33 (12)	100 (7)	86.21 (145)
What	87.04 (247)	74.19 (31)	83.33 (6)	85.56 (284)
When	85.71 (7)	– (0)	– (0)	85.71 (7)
Where	88.89 (9)	– (0)	– (0)	88.89 (9)
Which	92.35 (183)	100 (14)	83.33 (6)	92.61 (203)
Who	73.91 (23)	94.44 (18)	– (0)	82.93 (41)
Why	80.47 (128)	57.14 (14)	84.38 (32)	79.31 (174)
Yes/No	– (0)	100 (5)	– (0)	100 (5)
Several	82.11 (95)	68.42 (38)	75 (24)	77.71 (157)
Total	85.96 (819)	78.03 (132)	81.48 (81)	84.59 (1032)

- Accuracy for *wh*-questions based on concrete information from text is rather high, e.g., 92.6% for “which” questions.

Most important results

Question forms: hard case

	Literal	Reorganization	Inference	Total
Alternative	0 (1)	– (0)	66.67 (6)	57.14 (7)
How	85.71 (126)	83.33 (12)	100 (7)	86.21 (145)
What	87.04 (247)	74.19 (31)	83.33 (6)	85.56 (284)
When	85.71 (7)	– (0)	– (0)	85.71 (7)
Where	88.89 (9)	– (0)	– (0)	88.89 (9)
Which	92.35 (183)	100 (14)	83.33 (6)	92.61 (203)
Who	73.91 (23)	94.44 (18)	– (0)	82.93 (41)
Why	80.47 (128)	57.14 (14)	84.38 (32)	79.31 (174)
Yes/No	– (0)	100 (5)	– (0)	100 (5)
Several	82.11 (95)	68.42 (38)	75 (24)	77.71 (157)
Total	85.96 (819)	78.03 (132)	81.48 (81)	84.59 (1032)

- ▶ “why” questions are difficult (79.3%): Asking for reasons/causes supports more answer variation.

Most important results

Question forms: a puzzle

	Literal	Reorganization	Inference	Total
Alternative	0 (1)	– (0)	66.67 (6)	57.14 (7)
How	85.71 (126)	83.33 (12)	100 (7)	86.21 (145)
What	87.04 (247)	74.19 (31)	83.33 (6)	85.56 (284)
When	85.71 (7)	– (0)	– (0)	85.71 (7)
Where	88.89 (9)	– (0)	– (0)	88.89 (9)
Which	92.35 (183)	100 (14)	83.33 (6)	92.61 (203)
Who	73.91 (23)	94.44 (18)	– (0)	82.93 (41)
Why	80.47 (128)	57.14 (14)	84.38 (32)	79.31 (174)
Yes/No	– (0)	100 (5)	– (0)	100 (5)
Several	82.11 (95)	68.42 (38)	75 (24)	77.71 (157)
Total	85.96 (819)	78.03 (132)	81.48 (81)	84.59 (1032)

- ▶ “Alternative” questions are near random level (57.1%).
 - ▶ Why?

Information Structure

- ▶ Information Structure (IS) research investigates:
 - ▶ How is the meaning of a sentence integrated into the discourse?
- ▶ One relevant notion is **Givenness**:
 - ▶ “A constituent C counts as Given if there is a salient antecedent A for C, such that A either
 - ▶ co-refers with C,
 - ▶ is a synonym of C or
 - ▶ is a hyponym of C.” (Büring 2006)
- ▶ Our system as a first approximation excludes all words from alignment that appear in the question.
 - ▶ Motivation: Mentioned lexical material typically does not contain new information answering the question.
- ▶ However, in some interesting cases, the answer to a question does include given information.
 - ▶ Example: “Alternative” questions

From Givenness to Focus

Towards annotating focus

[Conclusion](#)

[References](#)

EBERHARD KARLS
UNIVERSITÄT
TÜBINGEN

From Givenness to Focus

- ▶ The IS notion of a **Focus** as the expression which addresses an explicit or implicit question under discussion (Krifka 2004) helps address the issue.
 - Given information is relevant when it is part of the focus.
- ▶ Making the focus explicit can also help in cases such as:

Q: **Was** muss die Meerjungfrau erleiden, wenn sie Menschenbeine haben will?

‘What must the mermaid suffer if she wants to have human legs?’

TA: Die Meerjungfrau muss **schreckliche Qualen** erleiden **bei jedem Schritt** .
The mermaid must horrible torment suffer with every step .

SA: Sie erleidet **bei jedem Schritt**.
She suffer with every step.

Towards annotating focus

- ▶ Idea: Integrate an automatic focus identification component into CoMiC.
- ▶ Approach should be informed by manual approaches to annotating information structure aspects:
 - ▶ Those targeting focus are moderately successful (Dipper et al. 2007; Calhoun et al. 2010).
 - ▶ In the CREG corpus, the explicit linguistic context (text, question) may support more reliable focus identification.
 - ▶ Information Status (Given vs. New) of referential expressions (Riester et al. 2010) may help as “backbone”.

Conclusion

- ▶ We presented the first content assessment system for German, CoMiC-DE
 - ▶ accuracy of 84.6% on authentic classroom data
 - ▶ competitive with results for English
- ▶ Detailed evaluation by question form and comprehension type
 - ▶ clear differences in performance
 - ▶ identifies avenues for future research improving analysis for specific question forms and comprehension types
- ▶ To identify which parts of an answer are most relevant for content assessment, information structure distinctions should be integrated.
 - ▶ manual annotation of the focus of an answer is a first step
 - ▶ explicit language-based context of task is crucial
